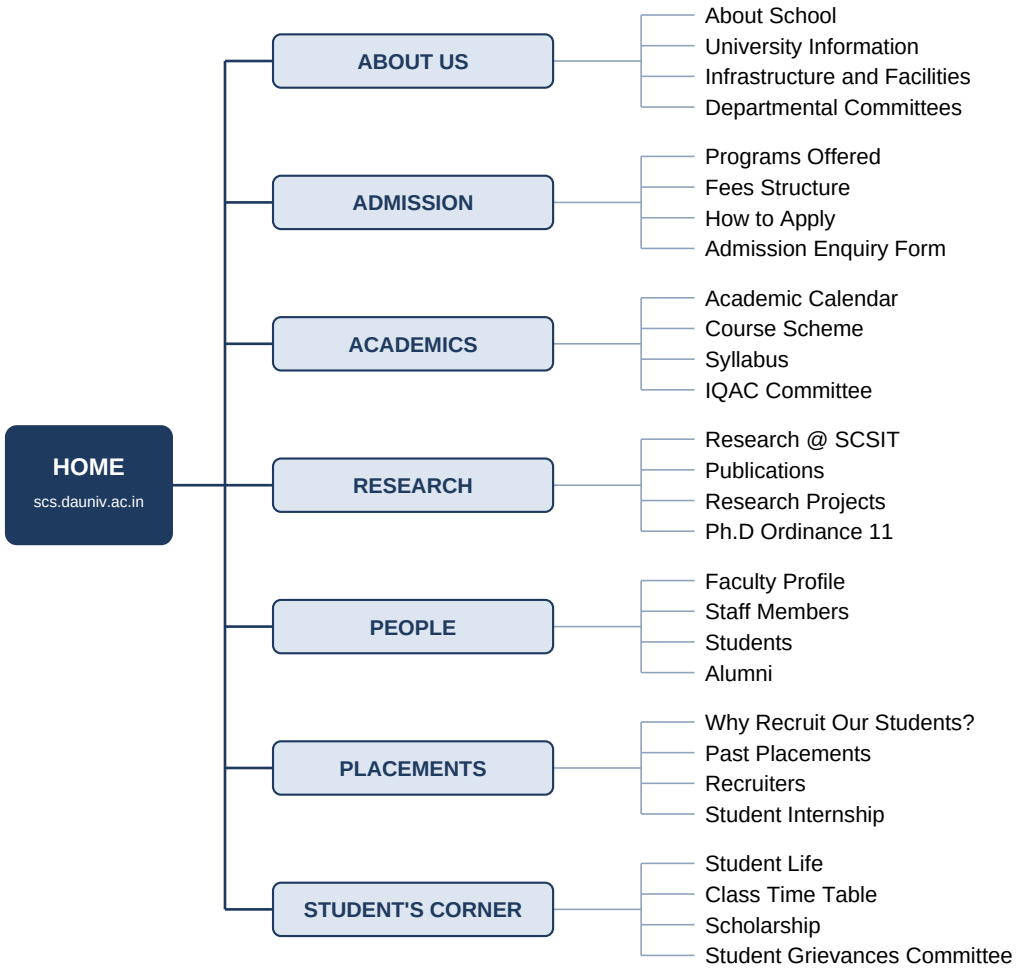
Q1. SCSIT, Website Architecture

Website: https://scs.dauniv.ac.in/ - School of Computer Science & IT, Devi Ahilya Vishwavidyalaya (DAVV), Indore (established 1986). **Users:** prospective students, current students, faculty/researchers, recruiters, alumni.

1. Structure of the website

- **Header:** school logo, name, university emblem and the main navigation bar (same on every page).
- **Home page blocks:** Message from Head, image slider, scrolling notice ticker, Vision and Mission, Latest @SCSIT (with VIEW ALL), Placement Highlights 2025-26, Our Recruiters & Partners.
- **Footer:** Head's address and emails + quick links (Examination & Results, Downloads, Library, Contact Us, Sitemap, Mandatory Disclosure, etc.) and social media icons.
- **Hierarchy:** 2 levels only - 8 main menu items, each with a drop-down (broad and shallow structure).

2. Site map (key items shown)



Full menu: Academics also has Syllabus, PEOs/POs/PSOs, CBCS & NEP-2020, Course Assessment; Research has 10 items; Student's Corner has 10 items.

3. IA components

Component	On the SCSIT site
Organization scheme	Topic-based (Admission, Academics, Research); audience-based (Student's Corner, Placements); chronological (notice ticker).
Labeling	Mostly clear ("How to Apply", "Student Life"); some jargon (PEOs, POs & PSOs, CBCS, IQAC); typo "Fees Structure".
Navigation	Global menu with drop-downs on every page, footer quick links, Sitemap link, VIEW ALL for notices.
Search	No search box visible - users must browse.

4. Evaluation

Strengths:

- Clear, consistent global navigation with simple labels.
- Every main user group has a section (Admission, Student's Corner, Research, Placements, Alumni).
- Shallow hierarchy - any page is about 2 clicks away.
- Placement highlights and recruiter logos show what the section contains.

Weaknesses:

- **No search box** - the biggest gap.
- **Long menus:** Research and Student's Corner have 10 items each.
- **Committees scattered** across five different menus.
- **Important items only in footer:** Examination & Results, Downloads, Library.
- **Duplication:** "Students" in People and Student's Corner; timetables in ticker, Latest @SCSIT and Student's Corner.
- **Moving ticker and slider** are hard to read and not accessible; three different emails for the Head.

5. Recommendations (IA principles)

- **Principle of choices:** split 10-item menus into groups (e.g. Student's Corner into Timetables, Support, Committees).
- **Multiple classification:** browse by audience, topic and document type.
- **Focused navigation:** add one "Committees" page; move Examination & Results to the main menu.
- **Front doors:** every page should show breadcrumbs, menu and related links, since visitors arrive from search engines.
- **Growth:** dated notice archive with filters; add a site search box.
- **Labels and access:** plain labels, fix the typo, pause controls for the ticker, mobile-friendly menu.

Conclusion: the SCSIT site has a clear, shallow, audience-aware structure. Adding search, regrouping long menus and reducing duplication would improve findability.

Q2. Information Technology vs Organizational Culture

Compare the impact of IT and Organizational Culture on end-user benefits using Tables 3 and 5 (r and R-squared). Why was IT the most influential factor?

Measure	Organizational Culture (Table 3)	Information Technology (Table 5)
Correlation r	0.70 (strong, positive)	0.82 (strong, positive - highest)
R-squared	0.49 (explains about 49%)	0.82 as stated in text (about 82%)*
T test	0.42 - supports hypothesis	2.48 vs 1.83 - supports hypothesis
Mean score (Table 1)	2.30 (77%)	2.50 (83%)

**Table 5 prints R-squared as 0.68; the paper's text says 82%. Either way IT is clearly higher than culture.*

Meaning

- r shows how strongly the factor moves with user benefit; R-squared shows how much of the variation in user benefit it explains.
- IT explains about 82% (18% left to other factors); culture explains 49% (more than half depends on other factors).

Why IT was the most influential

- **Direct benefit:** IT gives timely information, fast sharing and easy access to knowledge - exactly what the end user experiences as benefit.
- **Enabler:** knowledge management systems depend on technology (networks, databases, forums).
- **Tangible and uniform:** a system works the same for everyone, so ratings are consistent (top item: internal network to databases, 2.57).
- **Institutional support:** spending on IT (81%) and electronic forums (84%) already exist.

Why culture had lower impact

- **Indirect:** values and habits help only when systems exist to carry knowledge.
- **Intangible and uneven:** differs across departments and people, which weakens the statistical link.
- **Slow to change;** weakest item: treating mistakes as a source of learning (2.17, 72%).
- Still significant - 49% is a considerable impact.

Example: a student needs exam information. A good portal (IT) gives it in seconds; a helpful culture matters only if staff keep the portal updated.

Conclusion: IT and culture are complementary, but IT has the stronger direct effect. The paper advises strengthening culture so IT investment is fully used. (Limit: only 35 faculty at one university; correlation is not causation.)

Q3. Teamwork vs Decentralization

Paragraph 10 (teamwork) scored 2.62 (87%); paragraph 11 (decentralization) scored 2.00 (67%). Discuss the implications and how weak decentralization impedes knowledge flow.

Item	Statement	Mean	%
10	Focus on teamwork rather than individual work	2.62	87%
11	Decentralization of work, giving opportunity to share knowledge	2.00	67%
12	Structure allows flow of knowledge in all directions	2.20	73%

Meaning of the gap

Employees are encouraged to **collaborate** but have little **authority** to decide. They can share ideas but cannot always act on them.

Operational implications

- Decisions go up for approval - delays and bottlenecks.
- Team ideas stay in discussion and do not become practice.
- Low ownership - employees share less.
- Departments work in silos and repeat each other's work.

How weak decentralization impedes knowledge flow

- Knowledge moves mostly up and down the hierarchy, not across units (item 12 scored only 73%).
- Tacit (hidden) knowledge is not documented because people lack authority and incentive.
- Sharing stays inside a team; other teams cannot get or use it.
- Every new practice needs approval, so reuse is slow.
- Even a good IT network is under-used if staff are not empowered to publish and use knowledge.

Example: a team develops a good online-lab assessment method. Without decentralization it cannot be shared with other departments without many approvals, so only one team benefits.

Conclusion: teamwork builds willingness to share; decentralization gives the power and speed to apply it. The paper says the weak score shows a need to encourage knowledge sharing. **Remedy:** delegate routine decisions, create cross-department sharing forums.

Q4. End-User Categories and Information Architecture

Select two end-user categories, detail their operational goals, and explain how IA (integration, ease of access, reduced redundancy) supports them.

Categories chosen: (1) Students, (2) Faculty and Researchers.

1. Students

Operational goals:

- Understand academic and administrative requirements of their programme.
- Improve their academic and educational experience.
- Get quick service and support from the institution.

How IA supports them:

- **Information integration:** admission rules, fees, syllabus, timetables, results and notices linked in one portal.
- **Ease of access:** clear labels, task-based menus and search - a student finds the exam form or timetable in a few clicks.
- **Reduced redundancy:** one dated version of each notice and timetable avoids conflicting information.

Example: the fee date appears the same in the Fee Structure page, the notice and the academic calendar.

2. Faculty and Researchers

Operational goals:

- Understand policies and procedures for teaching, research and assessment.
- Improve academic performance and curriculum development.
- Advance research and apply results; collaborate with others.

How IA supports them:

- **Information integration:** course schemes, syllabi, assessment rules, Ph.D ordinance, projects and publications connected.
- **Ease of access:** tags and search to find publications, policies and labs quickly; the paper says easy access improves academic and administrative processes.
- **Reduced redundancy:** shared templates and a single record of each publication or policy remove repeated data entry.

Example: a Ph.D supervisor finds the ordinance, progress forms and earlier publications in one research section instead of several emailed versions.

Comparison

	Students	Faculty / Researchers
Goal	Learn and meet requirements	Teach, research, develop curriculum
Integration	Academic + administrative info in one portal	Teaching, research and policy info linked
Access	Quick task completion	Fast retrieval for research
Redundancy	Single trusted notices	No repeated entry; one policy version

Conclusion: effective IA saves time, avoids confusion and directly helps each group reach its goals.

Q5. Three-Part Strategic Plan for Knowledge Management

Outline a three-part plan with mechanisms for (a) leadership training, (b) new evaluation policies, (c) IT infrastructure and communication networks.

Basis (paper's findings): strong in continuous learning (91%) and teamwork (87%); weak in decentralization (67%), influencing subordinates (67%) and employee participation in decisions (68%). IT had the strongest effect on user benefit.

(a) Administrative leadership training in knowledge creation and sharing

- **Training programme** on how to create knowledge, plan its stages and develop it among employees.
- **Workshops, case studies and mentoring** using real university problems.
- **Specialized administrative categories** so professors are not burdened with work outside their expertise.
- **Leadership behaviour:** delegate decisions, involve staff, share information openly.
- **Follow-up:** refresher sessions each semester; track number trained and improvement in survey scores.

(b) New evaluation policies rewarding managers

- **Add knowledge KPIs** to appraisals: contributions to repository, documented best practices, mentoring, reuse of knowledge.
- **Reward ability to motivate others** to share (team and subordinate feedback).
- **Incentives:** awards, promotion points, preference for training and conferences.
- **Reward teams** as well as individuals so knowledge is not hoarded.
- **Transparent criteria,** reviewed every year.

(c) Upgrading IT infrastructure and internal communication networks

- **Speed:** upgrade campus network, bandwidth and servers linking all units and branches.
- **Central knowledge portal** with search, categories, version control and role-based access.
- **Internal tools:** intranet, collaboration platform and electronic forums for sharing knowledge.
- **Security:** authentication, encryption, backups, firewalls and cyber-security policy.

- **Support:** helpdesk, user training and a continuing IT budget.

Timeline and summary

Phase	Action	Responsible
0-6 months	Training needs survey, draft KPIs, audit network and security	Administration, HR, IT cell
6-18 months	Run training, launch new evaluation policy and knowledge portal, upgrade network	Deans, HODs, IT cell
18 months+	Review results, extend to all branches, keep investing	Administration, IQAC

Conclusion: training builds ability, evaluation policy builds motivation, and IT infrastructure provides the means - together they strengthen culture, leadership and structure and improve end-user benefit.
