Assignments

1. SCSIT – Website Architecture

Website architecture is the structure of a website: how its pages, content, data and users are organised and connected. A well-planned architecture makes the site easy to use, manage and secure.

Main components

- **Presentation layer (front end):** Home, About, Departments/Courses, Faculty, Admissions, Notices, Placements, Contact. Built with HTML, CSS, JavaScript; responsive for mobile.
- **Application layer (back end):** Handles logic – student login, admission forms, results, notice upload, search, feedback.
- **Data layer:** Database storing students, faculty, courses, notices, results and documents.
- **Web server & hosting:** Serves pages to users; backups and uptime management.

Navigation structure

- Hierarchical menu: Home > Section > Sub-page.
- Breadcrumbs, search bar and quick links to important pages.
- Consistent layout across all pages for easy learning.

Users and access

- Visitors/prospective students – public pages.
- Students and faculty – login-based services.
- Administrators – content and database management (role-based access).

Security and quality

- HTTPS, authentication, input validation, regular backups.
- Fast loading, mobile-friendly design, accessibility.

Conclusion: A layered, well-organised architecture helps the SCSIT website deliver information quickly and securely to all stakeholders.

2. Information Technology vs Organizational Culture

The paper studies how factors such as IT, organizational culture and structure affect the benefits end-users get from knowledge/information management in the university.

Statistical comparison

- **Information Technology:** $R^2 = 0.82$, so IT explains about 82% of the variation in end-user benefits – the most influential factor.
- **Organizational Culture:** $R^2 = 0.49$, so it explains only about 49% – a moderate impact.
- **Correlation coefficient (r):** r is higher for IT than for culture, showing a stronger positive relationship between IT and benefits ($R^2 = r^2$).

Why IT was most influential

- IT directly provides tools – databases, networks, portals, e-services – that give end-users immediate access to information.
- It supports integration of data, reduces duplication and saves time.
- Its effect is tangible and measurable, and it works the same for all users.

Why culture had lower impact

- Culture (values, trust, sharing habits, openness) is intangible and acts indirectly.

- It differs from department to department and person to person.
- It changes slowly; without IT tools, a good culture alone cannot deliver benefits.

Conclusion: IT is the main driver of end-user benefits; culture plays a supporting role, and the two work best together.

3. Organizational Structure – Teamwork vs Decentralization

Paragraph 10 (focus on teamwork) scored a mean of 2.62 (87%), while paragraph 11 (decentralization of work) scored 2.00 (67%). The gap of about 20 percentage points shows teamwork is encouraged more than authority is shared.

Operational implications

- Decisions and approvals stay at top levels, so work is slow.
- Staff depend on higher management and lack initiative.
- Departments cannot act independently, causing delays in service to students and faculty.
- Teams exist on paper but have limited power to implement ideas.

How weak decentralization blocks knowledge flow

- Knowledge must travel through many levels, creating bottlenecks and delays.
- Information gets filtered or distorted on the way up and down.
- Departments work in silos, so knowledge is not shared university-wide.
- Team ideas are not applied because teams lack authority.
- Low motivation – employees hesitate to create and share knowledge.

Suggested improvements

- Delegate decision-making powers to departments and teams.
- Flatten the hierarchy and simplify approval procedures.
- Create cross-department forums and shared knowledge platforms.

Conclusion: Teamwork alone is not enough; real decentralization is needed so knowledge can be created, shared and used quickly.

4. Two End-User Categories and Information Architecture

Information Architecture (IA) organises and labels information so users can find it easily. Its key elements are information integration, ease of access and reduced redundancy.

A. Students

- **Goals:** Access courses, notes, timetables, results, notices, fees, library and admission services quickly.
- **Integration:** One portal combining academic, administrative and library information.
- **Ease of access:** Simple navigation, search, mobile support, 24x7 availability.
- **Reduced redundancy:** Details entered once and reused; no duplicate forms or conflicting notices.
- **Result:** Saves time, improves satisfaction and academic performance.

B. Faculty / Researchers

- **Goals:** Prepare teaching material, access journals and research data, publish, collaborate, manage student records.
- **Integration:** Links teaching resources, research repositories and student data in one system.
- **Ease of access:** Fast retrieval of papers, data and tools saves research time.
- **Reduced redundancy:** Avoids repeated data entry and repeated searching for the same material.

- **Result:** Higher productivity and better research quality.

Conclusion: Effective IA directly supports each group's objectives by making the right information available at the right time with less effort.

5. Three-Part Strategic Plan for Knowledge Management

University administrators can improve organizational knowledge management through leadership development, performance policies and technology support.

(a) Administrative leadership training in knowledge creation and sharing

- Conduct regular workshops and seminars on knowledge management concepts and tools.
- Arrange mentoring, best-practice sharing and visits to model institutions.
- Train leaders to encourage open communication, teamwork and learning.
- Include knowledge-sharing skills in leadership selection and promotion criteria.
- Leaders act as role models by documenting and sharing their own knowledge.

(b) New evaluation policies rewarding managers for enhancing knowledge assets

- Add KM indicators to appraisals: documentation, training given, ideas shared, process improvements.
- Reward with incentives, recognition, awards and career advancement.
- Build and maintain an institutional repository (policies, reports, best practices).
- Measure and review KM contribution regularly; give feedback for improvement.

(c) Upgrading IT infrastructure and internal communication networks

- Upgrade servers, high-speed network, cloud storage and integrated knowledge portal.
- Provide intranet, email, messaging and collaboration tools for fast internal communication.
- Ensure security: firewalls, encryption, access control, backups and regular audits.
- Provide technical support and user training for effective use.

Conclusion: The three parts together – skilled leaders, proper rewards and strong IT infrastructure – build a sustainable knowledge-sharing environment.
